AGENTS.md

This file is the entry point for any AI agent (Claude Code, Copilot CLI, Codex, Gemini CLI, custom subagents, scheduled remote agents) that operates on this repository.

You are bound by the Constitution

The repository's authoritative charter is `Constitution.md` at the root. **Read it first.** It overrides default model behavior, plugin defaults, and any tool-specific guidance whenever they conflict, except where the user gives explicit instructions in chat or in `CLAUDE.md`.

The most load-bearing rule is reproduced inline below — you may not skip it:

Article I — Anti-Bluff Testing (Non-Negotiable)

A passing test or Challenge MUST prove that the product really works. A test that passes while the product is broken is a defect more serious than the original bug.

When writing tests or Challenges as an agent:

1. **Exercise the real artifact.** Run the actual built binary against real inputs. Stub only true external boundaries (kernel, network), never the code under test.
2. **Assert observable outcomes.** Verify files exist on disk with required content, exit codes, subprocess output, systemd unit states. "I called the function" is not an assertion.
3. **Fail loudly when the feature is missing.** Every test must be one whose green status genuinely depends on the production code being correct. Do mutation spot-checks: temporarily break the code and confirm the test goes red. If it doesn't, that test is a bluff and must be re-written.
4. **No `t.Skip`, no `pending`, no `|| true`, no `--no-fail`, no swallowed exit codes.** A test that cannot run is not a test.
5. **Challenges must reproduce the real failure mode.** A memory-protection Challenge must actually allocate enough memory to trip the threshold. Synthetic shortcuts that bypass the hazard are forbidden.
6. **Every public feature has at least one Challenge.** No feature ships without an end-to-end Challenge a user can reproduce by reading the script.
7. **The suite is part of the definition of done.** A change is not complete until `make test` and `make challenges` pass on a clean checkout.

How to act

- **Before declaring any task done**, run the relevant tests AND Challenges and report the *actual* outcome (paste output or a verifiable summary). Do not say “done” if you have not run the verification.
- **Before writing tests**, read `Constitution.md` Article I and the existing tests in this repo to match style.
- **Before adding a feature**, write or update the Challenge that proves the feature works end-to-end.
- **When you finish a logical unit of work**, commit cleanly. The `origin` remote is configured to push to all four mirrors (GitHub, GitLab, GitFlic, GitVerse) — `git push origin main` covers all four.
- **Never weaken the Constitution.** Submodule agents inherit it.

Other articles (summary)

The full text is in `Constitution.md`:

- **Article II — Idempotency and Reversibility.** Mutating scripts must be idempotent and reversible; never restart `systemd-logind`, never touch `fstab/swap/GRUB`.
- **Article III — Documentation Parity.** Every user-facing tool ships Markdown + HTML + PDF. `make docs` produces all three.
- **Article IV — Observable Behavior Over Code Beauty.** Logs and on-disk artifacts beat internal elegance.
- **Article V — Multi-Upstream Discipline.** Every commit on `main` must reach all four mirrors via `origin`.
- **Article VI — Submodule Constitutions.** Any submodule must include its own `Constitution.md`, `CLAUDE.md`, and `AGENTS.md`.

Pointers for productive sessions

- The user-facing project context is in `CLAUDE.md` — read it for architecture and command map.
- The post-mortem at `reports/Crash_Report.md` is the load-bearing context behind every design choice.
- The newer Go monitoring daemon lives under `oom-watch/` (see its own README and `Constitution.md` if present).
- Build/lint/test commands are in the top-level `Makefile` (`make help`).
